Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1922 Excerpt: .than it iswith an isolated muscle. The subject however of mechanical efficiency is dealt with below. The isometric contraction. The actual shortening of a muscle is a complex process, involving a variety of physical and mechanical factors, in addition to the purely physiological ones concerned with the extent and course of the response. In order to eliminate these extraneous factors it is advisable, where possible, to deal with rigidly isometric contractions. Physiological literature is burdened with observations which depend rather on the properties of levers than on those of muscles, and it is possible to avoid any mechanical complication by employing an isometric spring-myograph, with good sensitivity and high natural frequency. (See (23 p. 115), (65, p. 245), (10).) The effects of temperature. The rate of development of the isometric twitch has a high temperature coefficient, viz., about 2.5 for 10C., and its rate of disappearance a still higher one, about 3.6 (25). These point to chemical reactions as the basis both of contraction and of relaxation. Theories of muscular activity have tended to neglect relaxation, or to minimise its importance, attributing it in some vague way merely to a reversal of contraction. Its high temperature coefficient, however, and other more direct evidence, force us (see p. 320 below) to regard it as a positive process, due to its own special chemical reactions, and in no way subsidiary to the other processes of contraction. A rise of temperature affects not only the time-relations of a twitch...
